Its unequal

Women as skilled as men, but

- Less likely to be employed
- Earn 18% less or \$4.10 less hour for hour
- Earn \$700,000 less over their lifetime
- Lower superannuation
- Greater risk for poverty

Is the answer more work? (for women)

The hour-glass ceiling

- Ceiling on pay, career choice & advancement
- Time, not merit based
- Pushes women from long hour to shorter hour jobs
- Creates a two tiered labour market, locks in pay inequality

 Work hours

ABSTRACT

Long work hours erode health, which the setting of maximum weekly hours aims to avert. This 48-h limit, and the evidence base to support it, has evolved from a workforce that was largely male, whose time in the labour force was enabled by women's domestic work and care giving. The gender composition of the workforce has now changed, and many women (as well as some men) combine care-giving with paid work, a change viewed as fundamental for gender equality. However, it raises questions on the suitability of the work time limit and the extent it is protective of health. We estimate work-hour-mental health thresholds, testing if they vary for men and women due to gendered workloads and constraints on and off the job. Using six waves of data from a nationally representative sample of Australian adults (24–65 years), surveyed in the Household Income Labour Dynamics of Australia Survey (N = 3828 men, 4062 women), our study uses a longitudinal, simultaneous equation approach to address endogeneity. Averaging over the sample, we find an overall threshold of 39 h per week beyond which mental health declines. Separate curves then estimate thresholds for men and women, by high or low care and domestic time constraints, using stratified and pooled samples. We find gendered work-hour health limits (43.5 for men, 38 for women) which widen further once differences in resources on and off the job are considered. Only when time is 'unencumbered' and similar time constraints and contexts are assumed, do gender gaps narrow and thresholds approximate the 48-h limit. Our study reveals limits to contemporary work-hour regulation which may be systematically disadvantaging women's health.

1. Introduction

In 1930 the International Labour Organisation (ILO) set the maximum working week to 48 h. This remains the current hour limit beyond which, according to the ILO, no worker should exceed because of the potential health and safety risk (Lee et al., 2007; Spurgeon, 2003). These limits were set for a workforce that was once largely male, at a time when gender divisions were normative and paid work and caregiving separate endeavours. Now, in developed economies such as Australia, nearly two thirds of working-age women are in the labour force (one third in 1961, one fifth in 1947 Strachan and Burgess, 2002; Wilkins and Wooden, 2014). Work time expectations are also changing. Economies are digital, business communicates globally, and paid work can and does happen outside a standard eight hour day. For large segments of the labour force this is extending the working week, even while the gender composition is changing.

It is therefore not known if the maximum hour limit protects women's health, or the health of any employee who combines employment with caregiving. Men work more hours than women do in most developed countries (10 h per week averaged over 18 OECD countries, Landivar, 2015), but are able to do so because of their unequal involvement in child care or domestic work (OECD, 2016). Such inequalities in non-work time drive inequalities in the labor market, creating gender gaps in opportunities, income, participation and pay, what we term the hour-glass ceiling (Cha, 2010; Cha and Weeden, 2014; Jacobs and Gerson, 2006). We investigate if they also generate gender gaps in mental health, a leading cause of disability and disease burden worldwide (Whiteford et al., 2013). We seek to identify work-hour - mental health thresholds taking into account men's and women's gendered resources on and off the job, especially their

Methodology

- A simultaneous three-equation system:

Eq1: Work hours = f(Lagged work hours, **Mental health**, **Wages**, X1)

Eq2: Wages = f(Lagged wages, **Mental health**, X2)

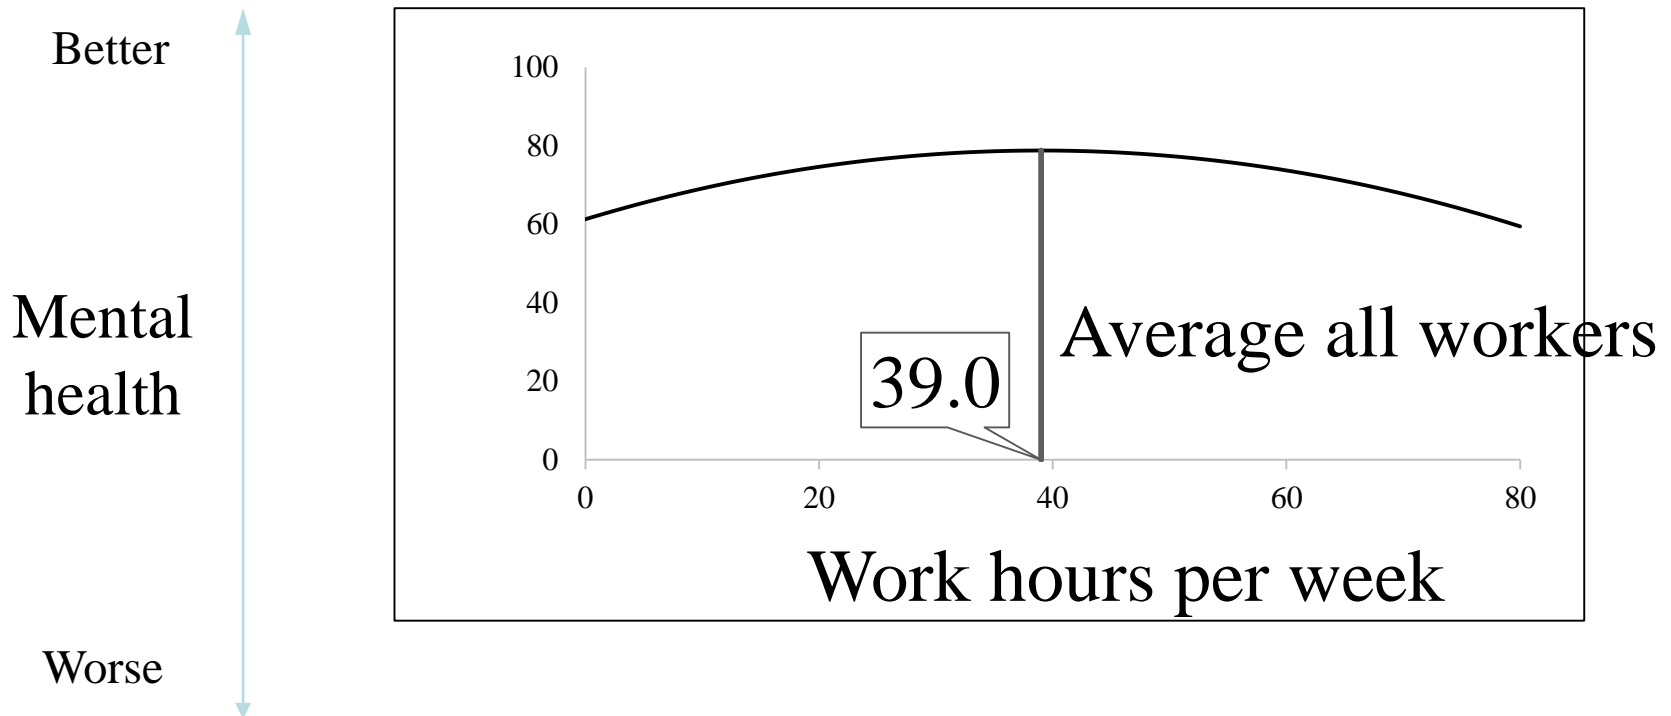

Eq3: Mental health = f(Lagged mental health, **Work hours**, **Work hours squared**, **Wages**, X3)

X1, X2, X3 – vectors of covariates (e.g., education, marital status, non-salary household income, domestic and care work time)

Data

- Six waves of Household Income and Labour Dynamics in Australia Survey (wave 5 –wave 10)
- Employed people, aged from 24 to 65
- Series of equations that do/do not assume men and women are equal on measured and unmeasured variables including non work time demands

Work hour thresholds averaged over gender, all things being equal

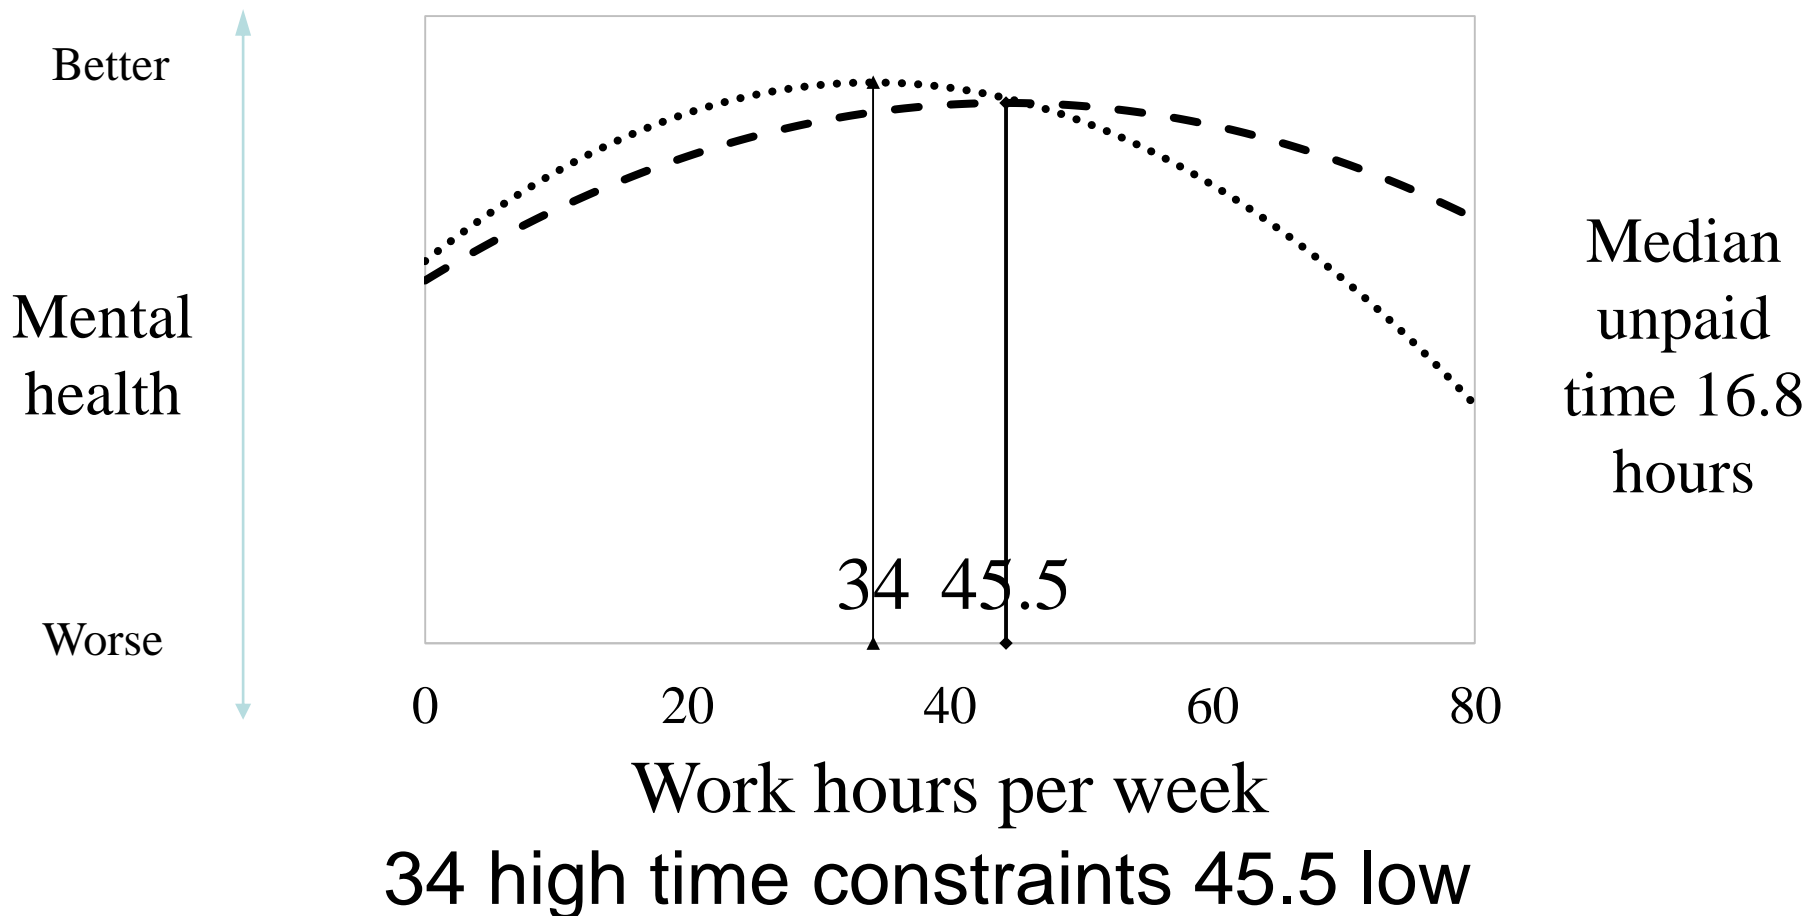

39 hours for everyone

Work hour thresholds by gender, allowing current inequalities to be estimated

Work hour thresholds, by time constraints (care and domestic work)

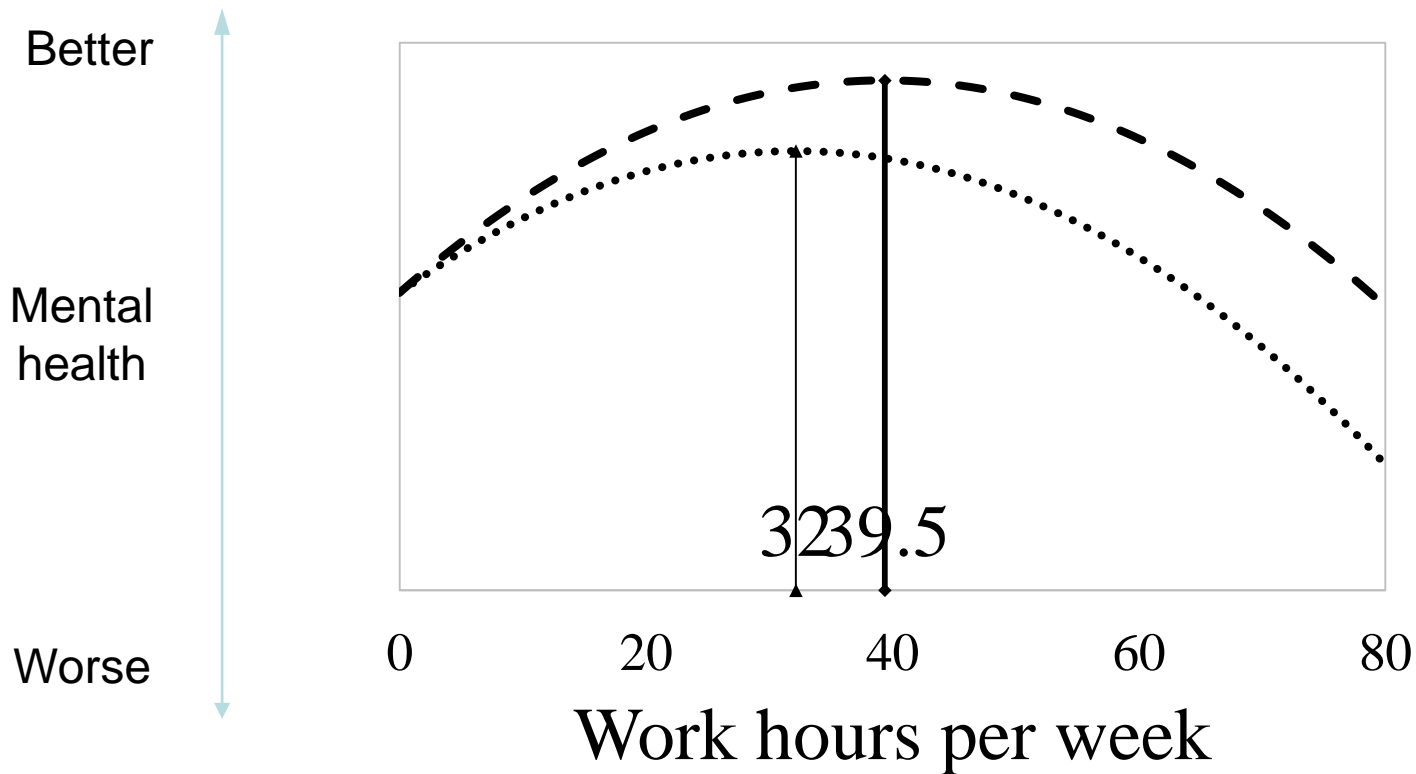

Work hour thresholds, for workers without care, all else equal

46 for women, 49 for men

Work hour thresholds, workers with care, all else equal

32 for women, 39.5 for men

Summary

- There is a work hour-health ceiling that varies by gender and care
- If women ‘work like men’ they face health trade-offs, as will men who combine work with care
- Health locks in the gender wage gap if long work hours are expected and rewarded

Not just a problem for women

- Fathers' long work hours
- Generate work-care dilemmas for fathers
 - Underpin gendered inequality in the labour market
 - Shape children's experience of being fathered

Questions for family policy

Do we want equality, do we want to boost the economy, could we have both?

Should women work like men? Should men work like women?

Can they?

So what to do?

- Too hard?
- It's the way things are?
- People have to work long hours if economies are to flourish?
- Should we get the economy right then address equality, or health?
- What could we imagine.....

Paid Parental Leave (PPL)

- Australia achieved its first, legislated paid leave scheme in 2011, just 6 years ago
- 2nd last OECD nation to do so

Policy goals

↑ Women's labour force participation

↑ Gender equality and improve work/life balance

↑ Health and wellbeing of babies and mothers
